

## The Website Settings page

On this page, there is a video of Wonder George explaining what the user can find and do on this page.

### The QR code

a downloadable QR code is displayed. This QR code leads to the user's website URL

#### Attach your domain

This is where the user can attach their domain name to their website. Domains are to be purchased with a registrar such as ionos, godaddy, namecheap or others. In order to attach the domain name, the user simply types in the domain name (mydomain.com), no http, in the field and clicks the attach button. Once attached, the user needs to redirect the domain to our server's IP that will be displayed here. In order to do that, the user needs to go to the DNS settings on his domain name's registrar console and modify the A record value IP address to our server's IP address. We have a video showing how to do it on Godaddy and ionos

### Google Analytics

In this field, the user can simply paste their Google Analytics script provided by Google and click "save" to save it. The Google analytics script will be published on all pages of the user's website.

### Facebook Pixel

In this field, the user can simply paste their Facebook Pixel script provided by Facebook and click "save" to save it. The Facebook Pixel script will be published on all pages of the user's website.
